

## Vibration plate

Automatic deburring of bores on inclined surfaces

## Customer application

The customer was looking for a solution that would enable the automated production of countersinks. In the previous process, milling the countersinks caused significant vibrations, which affected the quality of the result. A reliable and cost-effective solution was therefore required, one that would also save a considerable amount of time.

## Solution

The SOLO creates the recesses on the rear side automatically and reliably. The workpiece does not need to be turned over for machining, which results in significant savings in processing time.

## Customer benefits

- Automated generation of the planing cut – without having to turn the workpiece in the Machine
- Consistently high quality
- 80% reduction in cycle time
- Total annual savings: around EUR 100,000
