Important!

Watch out for uneven edges! If the bore edges are uneven, the unevenness must be taken into account in traverse distances. In the case of very uneven edges, we recommend traversing out of the bore when the spindle is stopped after machining has been completed.

The cutting data listed are guide values! They depend on the amount of the unevenness of the bore edges (e.g. high slope > low cutting value). For materials that are difficult to machine or uneven bore edges, we recommend applying cutting speeds that are at the lower end of the range.
